

BASIC PROGRAMMING PYTHON:

PYTHON

INTRODUCTION AND

FIRST PROGRAM

GRADE - 7

Forms x

LEARNING **OBJECTIVE**

1. Explain what a variable is and why programs need them.
2. Use the `print()` function to display output.
3. Use the `input()` function to receive information from a user.

Forms x

CODING AND PROGRAMMING

Coding means writing instructions for a computer using code.

Programming means using code and problem-solving to make a computer do a task.

Think about making tea:

Take a cup → Add sugar → Pour tea → Stir → Ready

These are instructions. In programming, we give instructions to a computer in a programming language.

Forms x

What is Python?

A programming language is a language that we use to give instructions to a computer.

Python is popular because it is relatively easy to read and learn.

Python can be used to create:

- websites
- games and applications
- data programs and AI programs

Forms x

First Python Program

Open your browser and go to the Python online editor:

<https://www.online-python.com>

You will see an editor (white space) to write Python code.

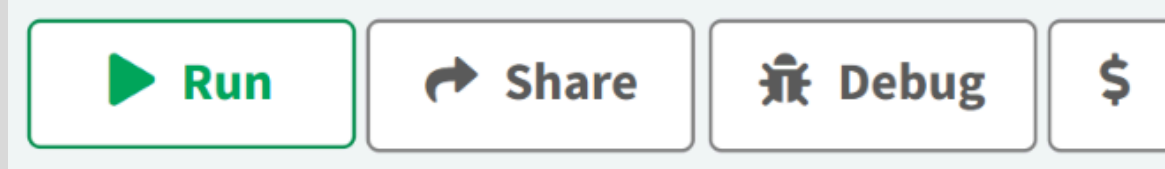

Forms x

First Python Program

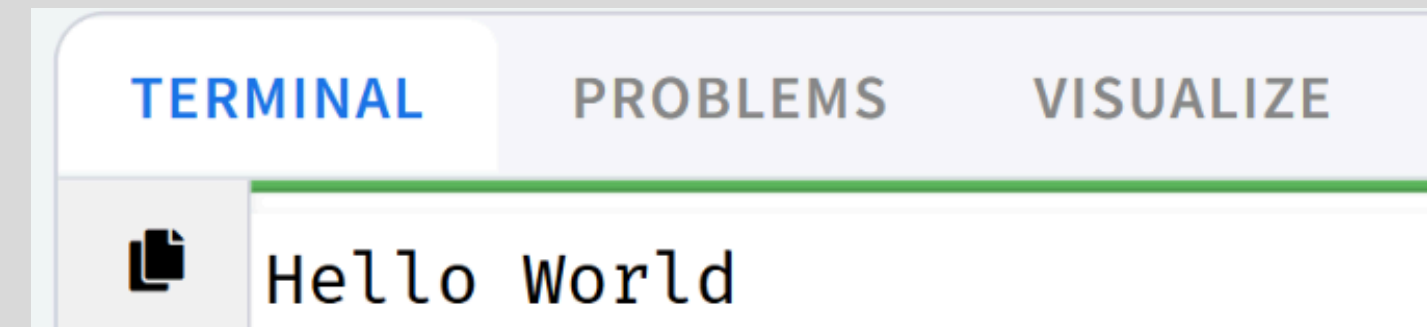

Write Your First Program In the editor, type this code:

```
main.py +
1 print("Hello World")
```

Then click Run:

You will see the output :

explanation:

print() → display something

"Hello World" → the text to display

Forms x

First Python Program

Challenge: Introduce Yourself

Write three `print()` commands to introduce yourself.

Include:

1. Your name
2. Your hobby
3. Something you like

Example:

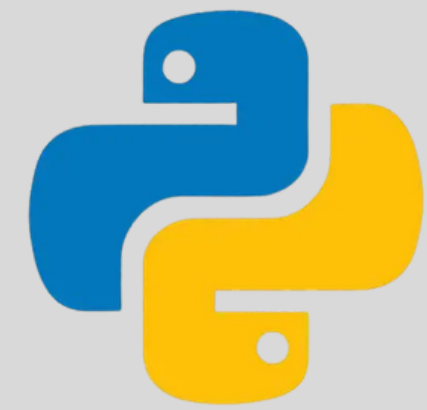

main.py

+

```
1 print("Hello!")
2 print("My name is Ade.")
3 print("I like games.")
```

VARIABLE IN PYTHON

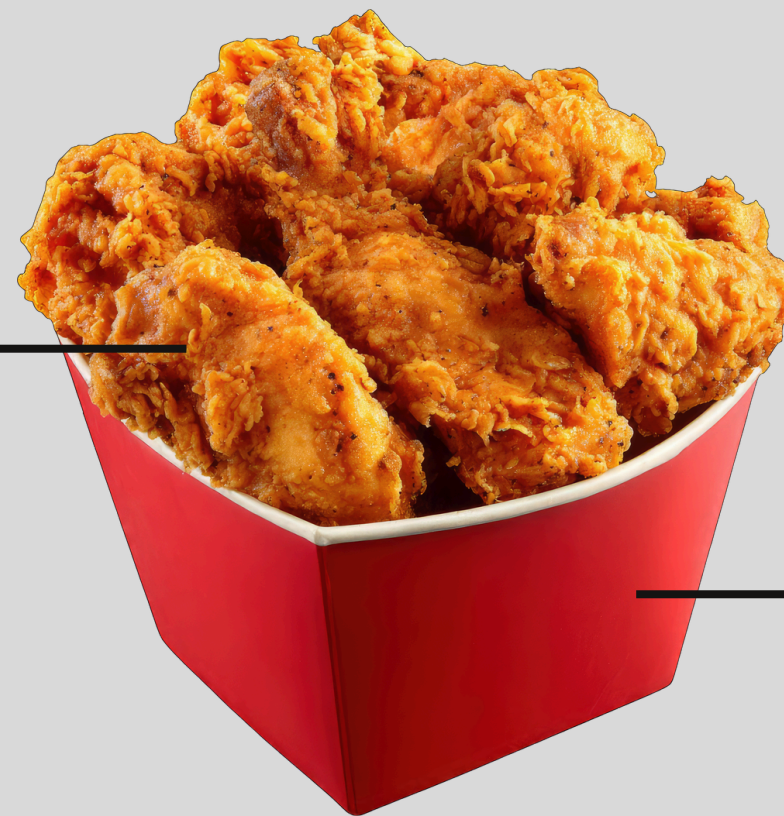

Forms x

VARIABLE

- A variable in Python is like a container that stores data.
- You can think of it like a box with a label (name).
- A variable can only store one piece of data at a time.

fried chicken
(data)

box(variable)

Forms x

Using VARIABLE

Code:

```
1 name = "Ade"
2 school = "Pelita Cemerlang"
3 print(name)
4 print(school)
```

output:

```
Ade
Pelita Cemerlang
```

Forms x

Getting from user (input user)

In Python, we can ask the user to enter data using the `input()` function.

The data entered will be stored in a variable so it can be used later in the program.

code:

```
name = input("What is your name?   :")
print(name)
```

output:

TERMINAL PROBLEMS VISUALIZE

```
What is your name?   :ade
ade
```

Forms x

Your First Interactive Program

Now let's make a simple introduction program.

code :

```
name = input("What is your name? :")
print("Hello ", name)
hobby = input("What is your hobby? :")
print("Your hobby is", hobby)
```

output :

```
What is your name? :ade
Hello ade
What is your hobby? :futsal
Your hobby is futsal
```

Forms x

Rules for Naming Variables

When creating a variable, remember:

- Use letters, numbers, and _

student_name score1

- Do not start with a number

1name → ✗ name1 → ✓

- Do not use spaces

student name → ✗ student_name → ✓

- Python is case-sensitive

name and Name are different variables.
